Precipitation Forecast

Short-term Outlooks

Short-term Outlooks

Hot Weather and Recent Dryness Create Favorable Conditions for Rapid Drought Development

Issued June 24, 2024

July 2-8, 2024

(a) Persistent warmer and drier than normal conditions over at least the last two weeks have impacted parts of the Mid-Atlantic, Southeast, and Southern Plains.

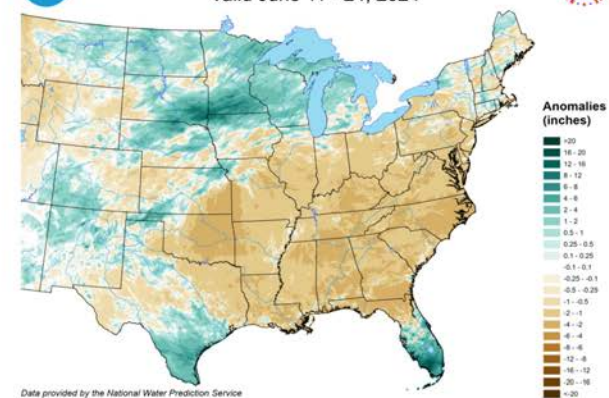

(b) These conditions have caused a risk of rapid onset drought. Hot and dry weather is likely to continue through the first week of July, with a moderate risk (40-60% chance) of excessive heat for several locations leading up to and including the 4th of July holiday.

Periodic, localized heavy precipitation cannot be ruled out due to frontal and/or daytime thunderstorm activity, which may provide a temporary reprieve, but no widespread heavy rainfall is anticipated.

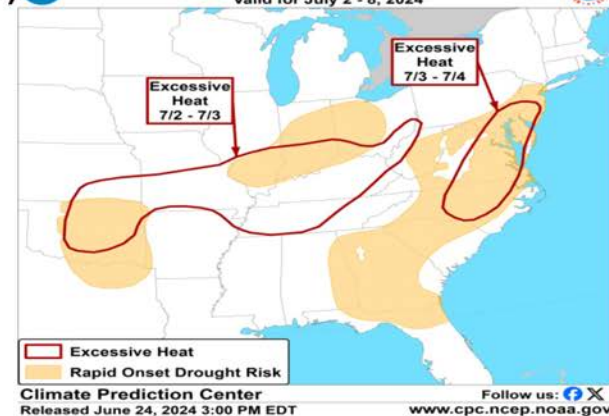

Dry soils, stressed vegetation, and reduced water availability due to low streamflows and groundwater may lead to increased impacts to agriculture and livestock, as well as increased fire danger. Several locations are already experiencing impacts.

* For short-term forecasts (prior to July 2), visit www.wpc.ncep.noaa.gov and weather.gov.

(a) Observed 14-day Precipitation Anomalies (inches)
Valid June 11 - 24, 2024

(b) Risk of Excessive Heat and Rapid Onset Drought
Valid for July 2 - 8, 2024

***Key messages are subject to change due to changes in forecast information and tools.

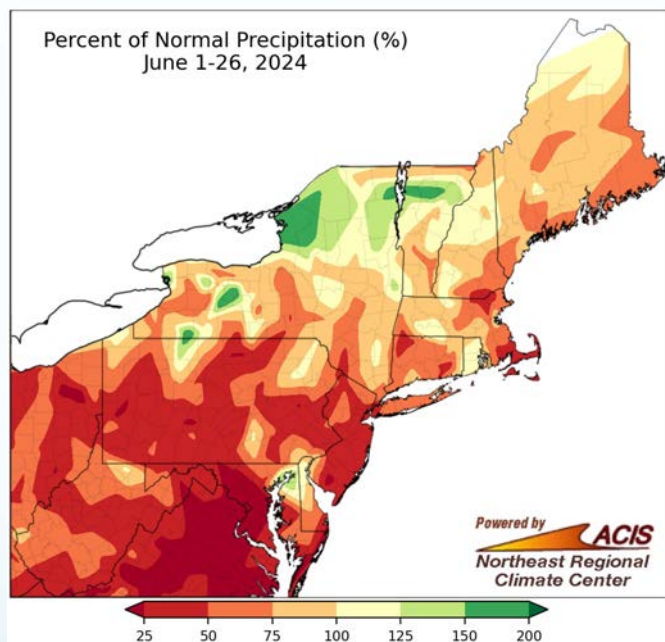

Monthly & 3-Month Outlooks

Summary

June-to-date conditions:

- Above-normal temperatures, driven by record or near-record heat mid-month
- Drier-than-normal for most areas; some spots with locally heavy rainfall

Drought:

- Drought introduced and abnormal dryness expanded in the Mid-Atlantic – something to keep an eye on!
- Some trimming of abnormal dryness in northern areas

Outlooks:

- Short-term: near- or above-normal precipitation and temperatures favored
- July: below-normal precipitation for interior areas; above-normal temperatures for all
- July-Sep: above-normal precipitation for areas close to the coast; above-normal temperatures for all

Drought Resources

Northeast Drought Early Warning News

April 23, 2024

Drought Conditions Update: Improvements Are Seen in Massachusetts and New York

- Recent rains were sufficient to support some recovery of groundwater levels on Nantucket. On last Thursday's U.S. Drought Monitor map for Massachusetts, only Abnormal Dryness (D0) remained.
- The Thursday, April 18 U.S. Drought Monitor also depicted only Abnormally Dry (D0) areas in western New York, with no drought. While Abnormal Dryness (D0) contracted in western New York over the past few weeks, D0 expanded along the coast of Lake Ontario from just east of Rochester to just south of Watertown.
- New York state's burn ban remains in effect through mid May.
- A low snow winter throughout the region still demands wildfire vigilance as warmer weather approaches.

Additional details are available in the [NRCC Blog](#).

Looking Further Ahead

- CPC's [Week 3-4 Temperature and Precipitation Outlooks](#) for May 4-17 (issued on April 19, 2024) call for equal chances of above/below normal temperatures and precipitation in our region. Status quo is likely for the Abnormal Dryness that remains in western New York and on Nantucket.
- The next Week 3-4 Outlook will be issued on Friday, April 26, 2024.
